

Product Overview — AI Order Intelligence for Social Commerce Sellers

In one line

A tool that sits behind a small seller's WhatsApp, Instagram, Facebook, and Telegram accounts, turns messy chat orders into clean structured orders, and predicts which orders will actually get delivered — so sellers stop losing money on returns.

The Problem (in plain words)

In India, millions of small sellers don't have a website. They sell through chat — a customer messages them on WhatsApp or Instagram, says "I want this in size M, COD," and the seller manually notes it down, ships it, and hopes for the best.

The problem: a huge number of these orders come back undelivered.

- Nationally, 25-40% of Cash-on-Delivery orders get returned (RTO — Return to Origin). For chat-based sellers, it's often worse, 50%+.
- Every returned order costs the seller ₹150-300 in wasted shipping, packaging, and time.
- Big brands (Nykaa, boAt, Mamaearth) solve this with tools like GoKwik — AI that checks the checkout and predicts if an order is risky.
- Small sellers on WhatsApp/Instagram have no such tool. They have no checkout page, no buyer history, no fraud check. They're flying blind.

So the real problem is: small chat-based sellers lose money on every bad order, and today, nothing helps them see it coming.

The Solution (in plain words)

We build a system that plugs into wherever a seller talks to their customers — WhatsApp, Instagram DMs, Facebook Messenger, Telegram — and does three things automatically:

1. **Understands the order** — reads the chat (even messy Hinglish, voice notes, or vague addresses like "near Hanuman mandir, pink house") and turns it into a clean, structured order: product, price, address, payment mode.
2. **Checks the risk** — before the seller ships it, the system scores how likely this order is to actually get delivered, based on things like the buyer's area, order value, payment type, and past behavior (if known).

3. **Helps the seller act on it** — confirms safe orders automatically, sends a quick "please confirm" message for risky ones, and suggests prepaid instead of COD when the risk is high.

Underneath, it also connects to the courier (Shiprocket, Delhivery, etc.) to book the shipment, and it learns from what actually happens to each order — delivered, returned, or cancelled — to get smarter over time.

In short: it's an AI assistant that reads the seller's chats, catches risky orders before they're shipped, and quietly improves the seller's delivery success rate — without asking the seller to change how they already sell.

Who is this for

- Instagram and Facebook page sellers (clothes, jewellery, home decor, etc.)
- WhatsApp-based resellers and small business owners
- Telegram-based sellers (resale, niche/drop-style selling)
- Any small seller who takes orders through chat instead of a website

These sellers are largely ignored by existing tools because those tools are built for big brands with real websites.

Why now

- Social commerce (selling via chat/DM) is exploding in India, especially in Tier-2/3 cities.
 - COD is still the dominant payment method, and COD is exactly where RTO is worst.
 - The government's ONDC push is trying to formalize this exact segment of unorganized sellers.
 - Big players (GoKwik, Shiprocket) are focused on brands with websites — they haven't gone deep into chat-native selling yet. That gap is open, for now.
-

How it actually works (step by step)

1. Seller connects their WhatsApp/Instagram/Facebook/Telegram account to our system.
2. A customer messages them to place an order.

3. Our system reads that message, pulls out the product, price, payment mode, and address — even if it's messy or in Hinglish.
 4. It checks the order against risk signals (delivery area, order value, payment type, buyer history if available) and gives it a risk score.
 5. Based on the score:
 - **Low risk** → order gets confirmed and passed straight to the courier.
 - **Medium risk** → system sends the buyer a quick confirmation message ("Reply YES to confirm your order").
 - **High risk** → system suggests the seller ask for prepaid, or a partial advance.
 6. Once shipped, we track what actually happens — delivered, returned, or cancelled — and feed that outcome back into the system so it keeps improving.
 7. All of this shows up on one simple dashboard for the seller — every order, from every platform, in one place, with one risk view.
-

What makes this different from just "another RTO tool"

- It doesn't ask sellers to build a website or change platforms — it works inside the chat apps they already use.
 - It works across all their channels at once (WhatsApp + Instagram + Facebook + Telegram), not just one.
 - Over time, as more sellers use it, the system starts recognizing repeat risky buyers across different sellers — something no single seller could ever see on their own. This shared, anonymous "buyer trust signal" is the real long-term value, not just the AI model itself.
-

Honest challenges we know about (and are planning for)

- **No historical data on day one.** We start with a simple, explainable rules-based risk score (not a black-box model), and only move to real machine learning once we have enough real outcomes to learn from. We may use simulated/synthetic data to bootstrap the very first version, but we're clear that this only helps us launch faster — it doesn't replace real-world learning.
- **Easy to copy in theory.** Our long-term protection isn't the algorithm — it's the network of sellers and buyer-outcome data we build over time, which a new competitor can't instantly replicate.
- **Multiple platforms mean multiple sets of rules.** WhatsApp, Instagram, and Facebook (all under Meta) require official APIs and message-approval processes;

Telegram is more open but attracts a different type of seller. We're building one shared core system with separate small connectors for each platform, so adding a new platform later doesn't mean rebuilding everything.

- **Privacy matters.** We only use anonymized buyer signals (delivery outcome patterns, not personal identity) to build the trust network, and we follow India's data protection rules on consent and storage.
 - **Getting sellers to actually use it (distribution)** is harder than building the AI. Our plan is to reach sellers through logistics partners, WhatsApp Business API providers, and seller communities rather than trying to market to individual sellers directly.
-

The one-line pitch (for judges/investors)

"An AI order-intelligence layer for India's unorganized social commerce sellers — across WhatsApp, Instagram, Facebook, and Telegram — that catches risky orders before they're shipped, unifies scattered chat orders into one dashboard, and builds a shared, privacy-safe buyer trust network that gets smarter with every seller who joins."
